PROFESSIONAL SUMMARY

I am a first-year Computer Science Engineering student specializing in Artificial Intelligence and Machine Learning, dedicated to building intelligent, real-world applications. Combining a strong foundation in Python and Object-Oriented Programming with an expanding skillset in frontend development, I enjoy bridging the gap between data-driven backends and clean user interfaces. From developing personalized ML recommendation systems to engineering generative AI solutions, I am passionate about continuous learning, open-source contribution, and solving complex technical challenges. I am actively engaging in "Build for India" projects and preparing to contribute to global open-source initiatives.

EDUCATION

Bachelor of Technology (B.Tech) in Computer Science Engineering

Specialization in Artificial Intelligence and Machine Learning • First Year

Intermediate Education (Class 11 & 12)

Science Stream

TECHNICAL SKILLS

Python (OOP)

Machine Learning

LangChain

SQL

MongoDB

React

JavaScript

HTML5 & CSS3

PROJECTS

Product Recommendation System

Python, Cosine Similarity ML Model, Streamlit

Engineered a smart recommendation engine utilizing cosine similarity to analyze product features and user preferences. The interactive web application provides highly personalized product suggestions, enhancing discovery efficiency and overall user experience.

Smart Inventory Forecasting Application

Python, Machine Learning, Predictive Analytics

Developed a predictive analytics solution designed to optimize supply chain efficiency and minimize stockouts. The application analyzes historical sales trends and seasonal patterns to generate highly accurate demand forecasts, helping businesses make data-driven inventory decisions.

HR RAG Chatbot

Python, LangChain, FAISS

Built an AI-powered conversational agent leveraging Retrieval-Augmented Generation (RAG) to accurately and instantly answer HR-related questions by intelligently retrieving data from integrated company documents.
